

Lesson 2: Combinations and Pascal's Triangle

Konstantin Miagkov

April 14, 2019

Recall from the lecture that the Pascal's triangle is a way of writing numbers $\binom{n}{k}$ in a shape of a triangle where $\binom{n}{k}$ is the k -th number in the n -th row.

Problem 1.

Show that the k -th number in the n -th row of Pascal's triangle is equal to the number of ways to descend from the top of the triangle to the k -th position in the n -th row while moving down-right or down-left every time.

Problem 2.

Show that if $n \geq 4$ and $2 \leq k \leq n - 2$, then

$$\binom{n}{k} = \binom{n-2}{k-2} + 2\binom{n-2}{k-1} + \binom{n-2}{k}$$

Problem 3.

If the ratios of three binomial coefficients are

$$\binom{n+1}{m+1} : \binom{n+1}{m} : \binom{n+1}{m-1} = 5 : 5 : 3$$

find n, m .

Problem 4.

a) Show that if p is prime and $1 \leq k < p$, then

$$p \mid \binom{p}{k}$$

b) Show that if p is prime, then

$$p \mid \binom{2p}{p} - 2$$

Problem 5.

Let $ABCD$ be a cyclic quadrilateral, and let T be the intersection of lines AB and CD . Assume A lies on the segment TB and D lies on the segment TC . Show that $TA \cdot TB = TC \cdot TD$.

Problem 6.

Let BB_1 and CC_1 be altitudes in a triangle $\triangle ABC$. Show that the tangent line at A to the circumcircle of $\triangle ABC$ is parallel to B_1C_1 .
